

Static & final Keyword

Page No.:

YOUVA
STELLAR

Date:

* Static keyword
class Student {

String name;
int age;
int rollNo;
~~String~~ college;
static String college;

now it is property
of class not object

are not stored
in heap

college = "IIT G"

S3.college = "IIT KGP"
it'll change college
for every objects in
the class

Student s1 = new Student();

s1.name = "Aditya";

s1.college = "IIT G";

Student.college = "IIT G" // → classname.variable = value;

* Static methods

class Student {

=====
=====

static void markAttendance() {

}

}

Student s1 = new Student();

Student s2 = new Student();

s1.markAttendance();

s2.markAttendance();

Student.markAttendance();

can be called both ways

Method $\rightarrow$ static

- $\rightarrow$ one static method can only call other static method.
- $\rightarrow$ static method can only access static variables.
- $\rightarrow$ does not have access to the keyword.

Static

- variables ✓
- methods ✓
- parameters (no) X (because parameters are local variables)
- class (X) (no) (but nested class can be static)

* final keyword

```
class Random {
```

```
    double pi =
```

```
    double pi; = 3.14;
```

```
    Random(double pi) {
```

```
        this.pi = pi;
```

```
}
```

X wrong

because pi is fixed

```
class Random {
```

```
    final double pi = 3.14; // PI-VALUE
```

↳ constants

PI = 3.14; (not allowed to assign another value)

```
}
```

~~final~~

final

- variable (✓)
- method (✓)
- class (✓)
- parameter (✓)

```
print (final String name) {  
    // now name can't be change  
}
```
