

* JVM, JRE & JDK

• JVM → Translate bytecode → Machine code

└ Source code → compiler → bytecode

→ now to convert this bytecode into machine code we have two ways

- Compiler → convert code all at once
- Interpreter → convert code line by line

• Java is both compiled & interpreted language

Earlier JVM only contains Interpreter
but nowadays JVM has Interpreter + JIT Compiler
↳ (Just in time)

∴

JVM also provides garbage collection

- JRE
→ JVM + class libraries

- JDK
→ JRE + compiler
+ Debugger
+ Javadocs

(core java)

JSE → Java Standard Edition

JEE → Java Enterprise Edition (Jakarta EE)

JME → Java Micro Edition

* first Java program

Create demo.java file & code

```
public class Demo {  
    public static void main (String [] args) {  
        System.out.println ("Hello World");  
    }  
}
```

Now in terminal run program by running these commands one by one

1. javac demo.java
2. java demo

Make sure you are in the same folder of terminal where these demo.java files are while running the commands.
